The comprehensive range of Swing Check Valves from IPC can be installed in horizontal as well as vertical lines. The Swing Check Valve, like all Check Valves, is used to prevent back flow in the line. The resultant pressure drop is minimal.

As the pressure below the disc increases it raises up from the seat to allow the flow. The valve closes with a drop in pressure on the inlet side and a build up of pressure on the outlet side. The disc is held in closed position owing to the back pressure in the line.

IPC is leading manufacturer of [Gate](#), [Globe](#) & [Check](#) valves. Integral Process Controls was founded in 2001 with an objective to solve two key pain points for the customers. First, was to reduce the valve delivery time, significantly, to meet the aggressive demand timelines of the clients. Secondly, we sensed a need to meet the huge and largely unmet need for assured supply of quality valve and valve automation solutions of the customers.
